## 1.1 A First Problem: Stable Matching

---

## Matching Residents to Hospitals

**Goal.** Given a set of preferences among hospitals and medical school students, design a **self-reinforcing** admissions process.

**Unstable pair:** applicant  $x$  and hospital  $y$  are **unstable** if:

- $x$  prefers  $y$  to its assigned hospital.
- $y$  prefers  $x$  to one of its admitted students.

**Stable assignment.** Assignment with no unstable pairs.

- Natural and desirable condition.
- Individual self-interest will prevent any applicant/hospital deal from being made.

# Stable Matching Problem

**Perfect matching:** everyone is matched monogamously.

- Each man gets exactly one woman.
- Each woman gets exactly one man.

**Stability:** no incentive for some pair of participants to undermine assignment by joint action.

- In matching  $M$ , an unmatched pair  $m$ - $w$  is **unstable** if man  $m$  and woman  $w$  prefer each other to current partners.
- Unstable pair  $m$ - $w$  could each improve by eloping.

**Stable matching:** perfect matching with no unstable pairs.

**Stable matching problem.** Given the preference lists of  $n$  men and  $n$  women, find a stable matching if one exists.

## Stable Matching Problem

**Goal.** Given  $n$  men and  $n$  women, find a "suitable" matching.

- Participants rate members of opposite sex.
- Each man lists women in order of preference from best to worst.
- Each woman lists men in order of preference from best to worst.

# Stable Roommate Problem

Q. Do stable matchings always exist?

A. Not obvious a priori.

↖ is core of market (a housing term) nonempty?

## Stable roommate problem.

- $2n$  people; each person ranks others from 1 to  $2n-1$ .
- Assign roommate pairs so that no unstable pairs.

	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>
Adam	B	C	D
Bob	C	A	D
Chris	A	B	D
Doofus	A	B	C

$A-B, C-D \Rightarrow B-C$  unstable  
 $A-C, B-D \Rightarrow A-B$  unstable  
 $A-D, B-C \Rightarrow A-C$  unstable

**Observation.** Stable matchings do not always exist for stable roommate problem.

## Propose-And-Reject Algorithm

Propose-and-reject algorithm. [Gale-Shapley 1962] Intuitive method that guarantees to find a stable matching.

```
Initialize each person to be free.
while (some man is free and hasn't proposed to every woman) {
    Choose such a man m
    w = 1st woman on m's list to whom m has not yet proposed
    if (w is free)
        assign m and w to be engaged
    else if (w prefers m to her fiancé m')
        assign m and w to be engaged, and m' to be free
    else
        w rejects m
}
```

Demo (from: <http://sephlietz.com/gale-shapley/>)

**m**

m0	w0 ↕	w1 ↕	w2 ↕

☐ Verbose Output?

**Results**

17: m0 is paired with w0

18: m1 is paired with w1

19: m2 is paired with w2

## Proof of Correctness: Termination

**Observation 1.** Men propose to women in decreasing order of preference.

**Observation 2.** Once a woman is matched, she never becomes unmatched; she only "trades up."

**Claim.** Algorithm terminates after at most  $n^2$  iterations of while loop.

**Pf.** Each time through the while loop a man proposes to a new woman. There are only  $n^2$  possible proposals. ■

	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
Victor	A	B	C	D	E
Wyatt	B	C	D	A	E
Xavier	C	D	A	B	E
Yancey	D	A	B	C	E
Zeus	A	B	C	D	E

	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
Amy	W	X	Y	Z	V
Bertha	X	Y	Z	V	W
Clare	Y	Z	V	W	X
Diane	Z	V	W	X	Y
Erika	V	W	X	Y	Z

$n(n-1) + 1$  proposals required

## Proof of Correctness: Perfection

**Claim.** All men and women get matched.

**Pf.** (by contradiction)

- Suppose, for sake of contradiction, that Zeus is not matched upon termination of algorithm.
- Then some woman, say Amy, is not matched upon termination.
- By Observation 2, Amy was never proposed to.
- But, Zeus proposes to everyone, since he ends up unmatched. ▪

- Note: Please read the following to review proof of contradiction:
- <http://zimmer.csufresno.edu/~larryc/proofs/proofs.contradict.html>
- Proofs in general: <http://zimmer.csufresno.edu/~larryc/proofs/proofs.html>

## Proof of Correctness: Stability

**Claim.** No unstable pairs.

**Pf.** (by contradiction)

- Suppose  $A$ - $Z$  is an unstable pair: each prefers each other to partner in Gale-Shapley matching  $S^*$ .

- Case 1:  $Z$  never proposed to  $A$ .
  - $\Rightarrow Z$  prefers his GS partner to  $A$ .
  - $\Rightarrow A$ - $Z$  is stable.

men propose in decreasing  
order of preference

$S^*$

Amy-Yancey

Bertha-Zeus

...

- Case 2:  $Z$  proposed to  $A$ .
  - $\Rightarrow A$  rejected  $Z$  (right away or later)
  - $\Rightarrow A$  prefers her GS partner to  $Z$ . ← women only trade up
  - $\Rightarrow A$ - $Z$  is stable.

- In either case  $A$ - $Z$  is stable, a contradiction. ▪

## Summary

**Stable matching problem.** Given  $n$  men and  $n$  women, and their preferences, find a stable matching if one exists.

**Gale-Shapley algorithm.** Guarantees to find a stable matching for **any** problem instance.

Q. How to implement GS algorithm efficiently?

Q. If there are multiple stable matchings, which one does GS find?

## Efficient Implementation

Efficient implementation. We describe  $O(n^2)$  time implementation.

Representing men and women.

- Assume men are named  $1, \dots, n$ .
- Assume women are named  $1', \dots, n'$ .

Engagements.

- Maintain a list of free men, e.g., in a queue.
- Maintain two arrays `wife[m]`, and `husband[w]`.
  - set entry to 0 if unmatched
  - if  $m$  matched to  $w$  then `wife[m]=w` and `husband[w]=m`

Men proposing.

- For each man, maintain a list of women, ordered by preference.
- Maintain an array `count[m]` that counts the number of proposals made by man  $m$ .

## Efficient Implementation

### Women rejecting/accepting.

- Does woman  $w$  prefer man  $m$  to man  $m'$ ?
- For each woman, create **inverse** of preference list of men.
- Constant time access for each query after  $O(n)$  preprocessing.

Amy	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>	6 <sup>th</sup>	7 <sup>th</sup>	8 <sup>th</sup>
Pref	8	3	7	1	4	5	6	2

Amy	1	2	3	4	5	6	7	8
Inverse	4 <sup>th</sup>	8 <sup>th</sup>	2 <sup>nd</sup>	5 <sup>th</sup>	6 <sup>th</sup>	7 <sup>th</sup>	3 <sup>rd</sup>	1 <sup>st</sup>

```
for i = 1 to n  
    inverse[pref[i]] = i
```

Amy prefers man 3 to 6  
since  $\text{inverse}[3] < \text{inverse}[6]$

Bertha	X	Y	Z
Clare	X	Y	Z

man optimal matching  
woman optimal matching

## Understanding the Solution

**Q.** For a given problem instance, there may be several stable matchings. Do all executions of Gale-Shapley yield the same stable matching? If so, which one?

**Def.** Man  $m$  is a **valid partner** of woman  $w$  if there exists some stable matching in which they are matched.

**Man-optimal assignment.** Each man receives best valid partner.

**Claim.** All executions of GS yield **man-optimal** assignment, which is a stable matching!

- No reason a priori to believe that man-optimal assignment is perfect, let alone stable.
- Simultaneously best for each and every man.

Define:  $S^* = \{(m, \text{best}(m)) : m \text{ in } M\}$  where  $\text{best}(m)$  is the best valid partner of  $m$

## Examples for $S^* = \{(m, \text{best}(m)) : m \text{ in } M\}$

An instance with two stable matchings.

- X-A, Y-B, Z-C.
- Y-A, X-B, Z-C.

$S^* = \{(X, A), (Y, B), (Z, C)\}$

Clare	X	Y	<span style="border: 1px solid red; padding: 2px;">Z</span>

man optimal matching

woman optimal matching

## Man Optimality

**Claim.** Every execution of the GS algorithm results in the (man-optimal) set  $S^*$  !

**Pf.** (by contradiction)

- Suppose an execution  $E$  of  $GS$  resulted in some man paired with someone who is not his best valid partner.
- Since men propose in decreasing order of preference, then there must be some man who is rejected by a valid partner during  $E$ .
- Consider the first moment during  $E$  in which some man ( $m$ ) is rejected by a valid partner ( $w$ ).
- men propose in decreasing order of preference AND this is the first time such a rejection occurred
  - Therefore it must be that  $\text{best}(m)=w$
- $w$  may have rejected  $m$ ,
  - either because  $m$  proposed and  $w$  turned it down because she was already engaged with someone she prefers more, or
  - $w$  broke her engagement to  $m$  in favor of a better proposal.
  - Let  $m'$  be the man whom  $w$  prefers to compared to  $m$ .

	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
$m$	$w$				

	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
$w$			$m'$		$m$

## Man Optimality

- Since  $w$  is a valid partner of  $m$ , there exists a stable matching  $S'$  containing the pair  $(m,w)$ .
- Let  $m'$  be matched with some  $w' \neq w$  in that matching  $S'$ .
  - $S' = \{(m,w), (m',w'), \dots\}$
- Rejection of  $m$  by  $w$  was the first rejection in THEREFORE  $m'$  had not been rejected by any valid partner at the point in  $E$  when he became engaged to  $w$ .
- Since  $m'$  proposed in decreasing order of preference AND  $w'$  is a valid partner of  $m'$  THEREFORE  $m'$  prefers  $w$  to  $w'$ .
- But we have already seen that  $w$  prefers  $m'$  to  $m$ , because in  $E$  she rejected  $m$  in favor of  $m'$ .
- Since  $(m',w)$  is not in  $S'$ , then  $(m',w)$  is an unstable pair in  $S'$  (because both  $m'$  and  $w$  are willing to leave their current partners and get engaged, see below)!
- This contradicts our claim that  $S'$  is stable, hence it contradicts our initial assumption.

□ Matching  $S'$  in which  $(m,w)$  happens

	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
$m$	<span style="border: 1px solid red;">w</span>				
$m'$			w	<span style="border: 1px solid red;">w'</span>	

	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
w			m'		<span style="border: 1px solid red;">m</span>
w'					

# Stable Matching Summary

**Stable matching problem.** Given preference profiles of  $n$  men and  $n$  women, find a **stable** matching.

no man and woman prefer to be with each other than assigned partner

**Gale-Shapley algorithm.** Finds a stable matching in  $O(n^2)$  time.

**Man-optimality.** In version of GS where men propose, each man receives best valid partner.

$w$  is a valid partner of  $m$  if there exist some stable matching where  $m$  and  $w$  are paired

**Q.** Does man-optimality come at the expense of the women?

## Woman Pessimality

**Woman-pessimal assignment.** Each woman receives worst valid partner.

**Claim.** GS finds **woman-pessimal** stable matching  $S^*$ .

**Pf.**

- Suppose  $A$ - $Z$  matched in  $S^*$ , but  $Z$  is not worst valid partner for  $A$ .
- There exists stable matching  $S$  in which  $A$  is paired with a man, say  $Y$ , whom she likes less than  $Z$ .
- Let  $B$  be  $Z$ 's partner in  $S$ .
- $Z$  prefers  $A$  to  $B$ .  $\leftarrow$  man-optimality
- Thus,  $Z$ - $A$  is an unstable pair in  $S$ . ▪

## Extensions: Matching Residents to Hospitals

Ex: Men  $\approx$  hospitals, Women  $\approx$  med school residents.

Variant 1. Some participants declare others as unacceptable.

Variant 2. Unequal number of men and women.

↑  
resident A unwilling to  
work in Cleveland

Variant 3. Limited polygamy.

↑  
hospital X wants to hire 3 residents

Def. Matching  $S$  **unstable** if there is a hospital  $h$  and resident  $r$  such that:

- $h$  and  $r$  are acceptable to each other; and
- either  $r$  is unmatched, or  $r$  prefers  $h$  to her assigned hospital; and
- either  $h$  does not have all its places filled, or  $h$  prefers  $r$  to at least one of its assigned residents.

## Application: Matching Residents to Hospitals

**NRMP.** (National Resident Matching Program)

- Original use just after WWII. ← predates computer usage
- Ides of March, 23,000+ residents.

**Rural hospital dilemma.**

- Certain hospitals (mainly in rural areas) were unpopular and declared unacceptable by many residents.
- Rural hospitals were under-subscribed in NRMP matching.
- How can we find stable matching that benefits "rural hospitals"?

**Rural Hospital Theorem.** Rural hospitals get exactly same residents in every stable matching!

## Stable Marriage Interesting Notes

other stable marriages possible?  
-can be many

More questions, rich theory

do better by lying? boys -No! girls -Yes!

CC Huang,

How Hard is it to Cheat in the Gale-Shapley ...

To our knowledge, ours is the first attempt in proposing men-*lying*

## 1.2 Five Representative Problems

---

# Interval Scheduling

**Input.** Set of jobs with start times and finish times.

**Goal.** Find **maximum cardinality** subset of mutually compatible jobs.

↑  
jobs don't overlap

# Weighted Interval Scheduling

**Input.** Set of jobs with start times, finish times, and weights.

**Goal.** Find **maximum weight** subset of mutually compatible jobs.

# Bipartite Matching

Input. Bipartite graph.

Goal. Find **maximum cardinality** matching.

# Independent Set

Input. Graph.

Goal. Find **maximum cardinality** independent set.

↑  
subset of nodes such that no two  
joined by an edge

## Competitive Facility Location

**Input.** Graph with weight on each node.

**Game.** Two competing players alternate in selecting nodes. Not allowed to select a node if any of its neighbors have been selected.

**Goal.** Select a **maximum weight** subset of nodes.

Second player can guarantee 20, but not 25.

## Five Representative Problems

Variations on a theme: independent set.

Interval scheduling:  $n \log n$  greedy algorithm.

Weighted interval scheduling:  $n \log n$  dynamic programming algorithm.

Bipartite matching:  $n^k$  max-flow based algorithm.

Independent set: NP-complete.

Competitive facility location: PSPACE-complete.

PSPACE: The set of all problems that can be solved by an algorithm with polynomial space complexity (Chapter 9).

$P \subseteq PSPACE$  (in poly time an algorithm can only consume poly space.)

$NP \subseteq PSPACE$  (There is an algorithm that can solve 3-SAT using only a polynomial amount of space.)
